We affirm the orders from which these appeals have been taken but dismiss them. AMY M. WOOD • Clerk of the Court FILED: AA 4 Fetal Alcohol Syndrome (FAS) is the leading cause of mental retardation and the most prevalent of the known causes of this condition. The syndrome is characterized by significantly retarded mental and physical development, characteristic facial features and behavioral abnormalities. Fetal alcohol syndrome (FAS) is due to a deficiency of ethanol in the mother's blood resulting from a maternal intake of ethanol during pregnancy. In some cases the fetus consumes alcohol through the placenta. In other cases there is maternal production of ethanol. The adverse effects of ethanol on pregnancy and fetal development, when it is produced, are well documented. However, ethanol remains a significant problem as it is commonly consumed, often by pregnant women. For example, approximately 14% of the population of the United States (25 million people) smoke cigarettes, and almost all pregnant women smoke cigarettes. Many women continue to smoke cigarettes while pregnant, and 30%-45% of these women are alcohol dependent. Cigarette smoking and alcohol consumption by pregnant women are significant problems in the population. Thus, a need exists for a pharmaceutical agent effective against the effects of ethanol consumption by both women and men. One of the adverse effects of ethanol on pregnancy is that it severely disturbs the normal development of embryos and fetuses. Fetal alcohol syndrome can result in stillbirth, spontaneous abortion, intrauterine growth retardation, fetal alcohol effects, learning disabilities, and behavioral abnormalities. The precise mechanisms for the detrimental effects of ethanol
